Custom Step-by-Step Guide for Reinstallation with MAAS on Fresh Ubuntu Server 24

Based on your request and the provided resources, here's a comprehensive plan for your Ubuntu Server 24 with MAAS integration utilizing your storage devices and maintaining the operational structure you envision. I've included adjustments for Ghost-based mirroring and SEO optimization plans, as well as the future implementation of your dockerized Aether network.

High-Level Objectives
```

1. Setup and Partitioning:
• Use your 500GB SSD for the OS and primary services.
• Secure OPNsense on the 256GB M.2 SSD for firewall and VPN.
• Optimize storage on the 12TB HDD, 3TB HDD, and 5TB portable HDD for data, backups, and media repositories.
• Assign the 1TB USB SSD for critical and fast-access application data.
2. MAAS Installation:
• Install MAAS for provisioning and managing nodes (physical and virtual).
• Prepare and manage Dockerized applications for WordPress, Nextcloud, Drupal, Laravel, and Ghost.
3. Custom Networking and Security:
• Integrate OPNsense as the primary security layer for all operations.
• Harden all systems with SSL, firewalls, and isolated Docker networks.
4. Ghost SEO and Mirror Optimization:
• Set up Ghost containers for your primary content delivery and mirrored domain reflection.
5. Documentation:
• Track all setups in Jupyter notebooks for transparency and reproducibility.

Preparation Checklist
1. Backup any critical data on your existing drives to a secure external source.
2. Gather:
• Ubuntu Server 24 ISO.
• OPNsense ISO (for M.2 SSD installation).
• Docker Compose files (docker-compose.yml from your Master Code Framework).
3. Prepare a secondary machine for remote management (optional but ideal).

Step 1: Install Ubuntu Server 24
1. Boot and Install Ubuntu:
• Use the 500GB SSD for installation.
• Allocate / (root) partition (200GB), /home (150GB), and /swap (16GB). Keep 134GB unallocated for flexibility.
2. Update and Upgrade:

```
sudo apt update && sudo apt upgrade -y
```

Step 2: Prepare Drives for Data Storage
1. Partition and Mount Drives:
• Format and mount your drives as follows:
• 12TB HDD: /mnt/aether
• 3TB HDD: /mnt/media
• 5TB Portable HDD: /mnt/portable
• 1TB USB SSD: /mnt/fast-access
Example commands:

```
sudo mkfs.ext4 /dev/sdb
sudo mkdir -p /mnt/aether
sudo mount /dev/sdb1 /mnt/aether
```

2. Edit /etc/fstab to ensure persistence:

```
UUID= /mnt/aether ext4 defaults 0 2
```

Step 3: Install and Configure MAAS
1. Install MAAS:

```
sudo apt install maas -y
sudo maas init
```

2. Configure Networking:
• Assign a static IP to the MAAS controller.
• Enable DHCP and DNS for node management in MAAS.
3. Access MAAS Web UI:
• Visit http://:5240/MAAS and complete initial setup.
4. Add Storage Pools:
• Integrate your 12TB and 3TB drives as MAAS storage pools for provisioning.

Step 4: Deploy OPNsense on the M.2 SSD
1. Install OPNsense:
• Boot into the OPNsense installer using your 256GB M.2 SSD.
• Configure OPNsense for:
• WAN to LAN routing.
• DNS filtering.
• OpenVPN setup.
2. Link OPNsense to MAAS:
• Assign MAAS nodes static IPs using OPNsense DHCP reservations.

Step 5: Set Up Docker Environment
1. Install Docker and Compose:

```
sudo apt install docker.io docker-compose -y
```

2. Deploy Applications Using docker-compose.yml:
• Use the Master Code Framework file to configure services like:
• MariaDB, Nextcloud, WordPress, Drupal, Laravel, and Ghost .
Example:

```
cd /mnt/aether/docker-backend
docker-compose up -d
```

3. Set Up Proxy and SSL:
• Configure NGINX proxy and Let's Encrypt for public domains:
• nextcloud.omniversal.cloud
• wordpress.omniversal.cloud
• ghost.omniversal.cloud

Step 6: Mirror Ghost for SEO Optimization
1. Primary Ghost Setup:
• Deploy Ghost using the provided docker-compose.yml.
• Configure environment variables (.env.ghost) to match your public domains .
2. Ghost Mirror Setup:
• Create a secondary Ghost instance with unique content identifiers.
• Cross-link with your main domains for enhanced SEO.

Step 7: Document Everything in Jupyter Notebooks
1. Install Jupyter:

```
sudo apt install python3-pip
pip3 install jupyter
```

2. Organize Configurations:
• Store all system logs, configurations, and steps in notebooks within /mnt/aether/docs.

Step 8: Test and Finalize
1. Verify:
• Nodes provisioned by MAAS.
• Applications running smoothly in Docker.
• Ghost SEO functionality.
2. Harden Security:
• Enable UFW firewall:

sudo ufw enable
sudo ufw allow 22,80,443/tcp

3. Backup:
• Use the 5TB portable drive for snapshots and /etc backups.

Next Steps
• Let me know if you'd like deeper focus on any specific component (e.g., SEO scripting, Docker setup, or MAAS troubleshooting).
• Confirm when you're ready to proceed—I'll guide you through each segment live or provide detailed sub-steps as needed.
